## Changing the Laravel 5.3 password reset email text

This entry was posted in [Laravel](#) on 12th November 2016 by Mark

Laravel

**Hello!**

Hey, did you forget your password? Click the button to reset it.

Reset Password

Thankyou for being a friend

Regards,  
Laravel

**Problem:** You use the out of the box authentication and password reset code. The email that is sent to the user is in English, but you need it in another language.

You know that you should never edit code that is in the vendor folder, so what do you do?

Thankfully, Taylor included a hook where we can write our own mailable notification, and the password broker provides the required token.

Assuming you have working boilerplate auth functions but you need to change the text of the password reset email as easily as possible;

### Create a notification

```
php artisan make:notification MailResetPasswordToken
```

edit this file which you find in a new folder App\Notifications

```
1 <?php
2
```

?

```
3 namespace App\Notifications;
4
5 use Illuminate\Bus\Queueable;
6 use Illuminate\Notifications\Notification;
7 use Illuminate\Contracts\Queue\ShouldQueue;
8 use Illuminate\Notifications\Messages\MailMessage;
9
10 class MailResetPasswordToken extends Notification
11 {
12     use Queueable;
13
14     public $token;
15
16     /**
17      * Create a new notification instance.
18      *
19      * @return void
20      */
21     public function __construct($token)
22     {
23         $this->token = $token;
24     }
25
26     /**
27      * Get the notification's delivery channels.
28      *
29      * @param mixed $notifiable
30      * @return array
31      */
32     public function via($notifiable)
33     {
34         return ['mail'];
35     }
36
37     /**
38      * Get the mail representation of the notification.
39      *
40      * @param mixed $notifiable
41      * @return \Illuminate\Notifications\Messages\MailMessage
42      */
43     public function toMail($notifiable)
44     {
45         return (new MailMessage)
46             ->subject("Reset your password")
47             ->line("Hey, did you forget your password? Click the button to
48 reset it.")
49             ->action('Reset Password', url('password/reset', $this-
50 >token))
51             ->line('Thankyou for being a friend');
52     }
```

```
}
```

## Override the send password reset trait with your local implementation in your User.php user model

```
1  /**
2   * Send a password reset email to the user
3   */
4   public function sendPasswordResetNotification($token)
5   {
6       $this->notify(new MailResetPasswordToken($token));
7   }
```

remembering to import the class at the top of the user model

```
1  use App\Notifications\MailResetPasswordToken;
```

If you need to alter the layout of the message, including the text “If you’re having trouble clicking the “Reset Password” button,” then you need to run

```
php artisan vendor:publish
```

and then edit the files in

```
/resources/views/vendor/notifications
```

**Timofey***17th October 2017 at 5:58 am*

You also can just extend a default notification and then just override it's toMail function

**vandev***17th November 2017 at 9:16 pm*

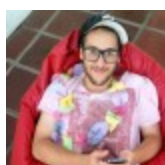

Thanks so much, It work for me

**Guillermo Nuñez***21st November 2017 at 10:45 pm*

Thanks a lot, I couldn't find this anywhere, used this guide on laravel 5.4 and worked perfectly

**Ankit***3rd January 2018 at 6:16 pm*

Thanks a lot, You save y time.

**Giovanni Pires da Silva***8th January 2018 at 3:42 am*

Thank you, your post was useful. =)

**Laravel Fanatic***19th January 2018 at 4:10 pm*

This save me a lot! Thanks!
